GHOSTWIRE

APPLIED CRYPTOGRAPHY & PROTOCOL ENGINEERING

The complete cryptographic reference for the GW1 secure messaging protocol — primitives, proofs-of-correctness, annotated source code, test-vector corpus and maintenance operations.

developed by @Ariko & Arena

GHOSTWIRE PROJECT // EDITION 1.1 // PROTOCOL GW1 // APP v1.1.0

GHOSTWIRE — Applied Cryptography & Protocol Engineering

Edition 1.1, protocol GW1, application v1.1.0. This book documents every cryptographic primitive used by the GHOSTWIRE tactical messenger, the protocol that composes them, the exact source code that implements them, and the operational procedures required to keep a deployment trustworthy.

Copyright © GHOSTWIRE Project. This documentation is provided with the application for audit and maintenance purposes. The software and text in this volume may be freely studied and quoted with attribution: developed by @Ariko & Arena.

DISCLAIMER — No system is unbreakable. This book repeatedly states the residual risks of the design (endpoint compromise, metadata exposure, lack of post-quantum primitives). Read Chapter 25 before operating the tool with real traffic.

Contents

GHOSTWIRE — Applied Cryptography & Protocol Engineering 2

Preface — How to Read This Book 9

Conventions 9

Notation Summary 9

Standards Inventory 9

Chapter 1 — Design Goals and Threat Model 12

1.1 What GW1 provides 12

1.2 What GW1 does not provide 12

1.3 Attacker classes 12

Chapter 2 — Cryptographic Preliminaries 13

2.1 Kerckhoffs' principle 13

2.2 Keys, entropy and uniqueness 13

2.3 Security notions used 13

2.4 Fail-closed philosophy 13

Chapter 3 — Data Representation and Framing 14

3.1 Byte-level conventions 14

3.2 Frame layout of the transport cipher 14

3.3 Length-prefixed transport framing 14

Chapter 4 — Randomness and Key Generation 15

4.1 The only entropy source 15

4.2 Key clamping and validation 15

4.3 Key hierarchy 15

Chapter 5 — SHA-256 17

5.1 Construction 17

5.2 Security properties relied upon 17

5.3 Uses inside GW1 17

5.4 Implementation notes 17

Chapter 6 — HMAC-SHA256 18

6.1 Definition . . . 18

6.2 Role in GW1: key confirmation . . . 18

6.3 Constant-time discipline . . . 18

Chapter 7 — HKDF and Domain Separation 19

7.1 RFC 5869 structure . . . 19

7.2 Why the salt is the session id . . . 19

7.3 The info strings (domain separation table) . . . 19

Chapter 8 — AES-256 21

8.1 The block cipher . . . 21

8.2 Why 256 . . . 21

8.3 Where it runs . . . 21

Chapter 9 — Galois/Counter Mode 22

9.1 Construction . . . 22

9.2 Parameters fixed by GW1 . . . 22

9.3 The nonce-reuse catastrophe and its structural prevention . . . 22

9.4 Verification behaviour . . . 22

Chapter 10 — Symmetric-Hash Ratchets and Per-Message Forward Secrecy 23

10.1 Chain mechanics . . . 23

10.2 Synchronisation and fail-closed desync . . . 23

10.3 Comparison with the Double Ratchet . . . 23

10.4 Erasure guarantees . . . 23

Chapter 11 — Elliptic Curve Primer 25

11.1 Why 25519 . . . 25

11.2 The two problems assumed hard . . . 25

Chapter 12 — X25519 Diffie–Hellman 26

12.1 The Montgomery ladder . . . 26
12.2 Clamping . . . 26
12.3 Correctness vectors . . . 26

Chapter 13 — Ed25519 Signatures 27

13.1 Signing . . . 27
13.2 Verification . . . 27
13.3 Determinism as a feature . . . 27
13.4 Usage in GW1 . . . 27

Chapter 14 — Pure-Python Cryptography on Android: A Case Study 28

14.1 The incident . . . 28
14.2 The fix . . . 28
14.3 Lessons codified as maintenance rules . . . 28

Chapter 15 — Protocol Overview and Session Lifecycle 30

15.1 Roles and states . . . 30
15.2 Session identity . . . 30

Chapter 16 — The Handshake, Annotated 31

16.1 Hello payload . . . 31
16.2 Verification steps (consume_hello) . . . 31
16.3 Derivation and confirmation . . . 31
16.4 Attack walkthroughs . . . 31

Chapter 17 — Transport Cipher, Framing and Transience 32

17.1 Frame production . . . 32
17.2 TTL and burn-after-read . . . 32
17.3 Control frames . . . 32

Chapter 18 — Discovery, Transports and Failure Handling 33

18.1 Discovery . . . 33
18.2 Transports . . . 33

18.3 Failure taxonomy 33

Chapter 19 — gw/_curve25519.py (Pure-Python Core) 35

Chapter 20 — gw/crypto.py (Protocol Cryptography) 39

20.5 Invariants enforced by this file 42

Chapter 21 — gw/net.py (Secure Link and Node) 43

Chapter 22 — Packaging and Platform Security 47

22.1 buildozer.spec (shipped) 47

22.2 Security-relevant manifest properties 47

22.3 Bundle composition verified at release 47

Chapter 23 — Maintenance and Upgrade Guide 49

23.1 Dependency matrix 49

23.2 Standard upgrade procedure 49

23.3 What must NEVER change without a protocol review 49

Chapter 24 — Validation and Testing 50

24.1 The three-tier suite 50

24.2 On-device acceptance checklist 50

Chapter 25 — Incident Response and Operational Discipline 51

25.1 Fingerprint verification SOP 51

25.2 Compromised-device playbook 51

25.3 Honest threat notes (operator-facing) 51

Chapter 26 — Operating GHOSTWIRE 53

26.1 Requirements and installation 53

26.2 First boot and the splash 53

26.3 Home screen — NODE CONTROL 53

26.4 ESTABLISH UPLINK — initiating a session 54

26.5 Discovery — the SCAN screen 54

26.6 CHAT — the secure channel . . . 54
26.7 SECURITY PROTOCOLS screen . . . 55
26.8 Typical session, start to finish . . . 55

Preface — How to Read This Book

GHOSTWIRE is a two-party encrypted messenger built for constrained, adversarial environments: local Wi-Fi segments, Bluetooth RFCOMM links, and Android devices that cannot be fully trusted. It was designed around one conviction — a messaging tool whose cryptography cannot be read, audited and re-implemented by its operator is not a security tool, it is a promise. This book is the audit trail.

The volume is organised in eight parts. Part I establishes the threat model and the conventions everything else rests on. Parts II–IV treat each primitive family in depth: hashes and MACs, symmetric ciphers, and public-key primitives including the pure-Python Curve25519/Ed25519 core that makes the Android build immune to native-library loading failures. Part V specifies the GW1 protocol itself — handshake, ratchet, framing, transience. Part VI prints the actual source code with engineering annotations. Part VII is the maintenance and engineering guide. Part VIII is the field manual: how to operate the program, its strengths and its honest limitations, and how to run it across wide-area networks. The appendices contribute a generated, machine-checkable test-vector corpus, the validator that consumes it, a glossary and references.

Conventions

- Hex strings are lower-case, byte order as transmitted; multi-byte integers are big-endian unless stated.
- `code faces` denote identifiers, field names and wire values; *italics* introduce terms.
- KEY_BYTES always means 32; nonces are 12 bytes; GCM tags are 16 bytes; signatures are 64 bytes; public keys are 32 bytes.
- Every ‘SECURITY’ note marks a property an attacker must not be able to violate; every ‘MAINTENANCE’ note feeds Chapter 23.

Notation Summary

Symbol	Meaning
`a || b`	concatenation of byte strings
`H(m)`	SHA-256 digest of m
`HMAC(k, m)`	RFC 2104 HMAC with SHA-256
`HKDF(ikm, info, salt)`	RFC 5869, SHA-256, 32-byte output
`X25519(k, P)`	Montgomery-ladder scalar multiplication
`Ed25519.sign(sk, m)`	RFC 8032 pure signature
`AEAD(k, n, aad, pt)`	AES-256-GCM encrypt+authenticate
`chain ← step(chain)`	HKDF ratchet advance (old state erased)

Standards Inventory

Every primitive in the GW1 suite is a named, public standard — the same panel is shown in the app's SECURITY PROTOCOLS screen:

Standard	Role in GW1
RFC 7748	X25519 elliptic-curve Diffie-Hellman (Ch. 11–12)
RFC 8032	Ed25519 signatures for mutual authentication

Standard	Role in GW1
RFC 5869	HKDF-SHA256 key schedule and ratchet
RFC 2104	HMAC-SHA256 key confirmation
NIST SP 800-38D	AES-256-GCM authenticated encryption
FIPS 180-4	SHA-256 digest throughout

PART I — FOUNDATIONS

Chapter 1 — Design Goals and Threat Model

GHOSTWIRE assumes the network is hostile. Every byte that traverses Wi-Fi or Bluetooth is assumed to be recorded, replayed, injected into and selectively deleted by an active adversary with full control of the medium. The design goals that follow from that assumption are, in priority order: mutual authentication of the two endpoints; confidentiality and integrity of every frame; per-message forward secrecy; transience of content; and fail-closed behaviour on any anomaly.

1.1 What GW1 provides

- Mutual entity authentication via long-term Ed25519 identity keys whose SHA-256 fingerprints are compared out-of-band.
- Authenticated key agreement via ephemeral X25519 ECDH bound to signed transcripts (SIGMA family), defeating relay and rebinding attacks.
- Confidentiality and integrity with AES-256-GCM under a fresh key per message, derived from a symmetric ratchet.
- Per-message forward secrecy: ratchet chain state is deleted after each step, so compromising a process at time t does not decrypt frames from before t.
- Transience: time-to-live enforced on both peers; bilateral burn-after-read deletion; nothing persisted to disk.

1.2 What GW1 does not provide

Honesty about residual risk is a security feature. GW1 does not provide anonymity or metadata hiding (an observer sees who talks to whom, when, and at what volume); post-quantum resistance (a quantum adversary recording today's traffic could break X25519 retrospectively); deniability of a different flavour than signatures imply; or protection against a compromised endpoint — a device under your adversary's control reads plaintext before encryption and after decryption. These limits are displayed inside the application itself on its Security screen.

1.3 Attacker classes

Class	Capability	GW1 outcome
Passive eavesdropper	records all frames	no plaintext, no session keys; transcript hash public only as session id
Active MITM	inject/modify/replay	handshake signature + confirmation MAC fail closed; ratchet desync kills link
Relay / rebinder	forwards hellos between pairs	server signature binds client hello; transcript mismatch fails
Later compromise	full memory at time t	frames before t protected by ratchet erasure; identities are signing-only
Quantum (store-now)	future QC	broken — see §1.2
Compromised endpoint	rooted device	broken — see §1.2

Chapter 2 — Cryptographic Preliminaries

A cipher is a family of functions indexed by a key; security means that a bounded adversary cannot distinguish its use from an ideal object (a random permutation, a random function, a private channel). This chapter fixes the vocabulary used for the rest of the book.

2.1 Kerckhoffs' principle

The algorithm is public; only the key is secret. Everything in this volume — including this book — is part of the public description. Consequently no security argument in GHOSTWIRE may rely on an opponent not having read this document.

2.2 Keys, entropy and uniqueness

All secret material is drawn from the operating system CSPRNG (`os.urandom`, backed by the kernel ChaCha20 pool): 32-byte identity secrets, 32-byte ephemeral X25519 secrets, and every ratchet seed. Two properties matter more than raw randomness: uniqueness (no nonce, no ephemeral key, no ratchet state is ever repeated) and secrecy-after-use erasure (ratchet chain values are overwritten by the next step). AES-GCM's entire security collapses under nonce reuse with the same key; the ratchet design makes reuse structurally impossible because the counter is embedded in the nonce and monotonic per direction.

2.3 Security notions used

- PRF/PRP indistinguishability for HMAC and AES.
- EUF-CMA (existential unforgeability under chosen message attack) for Ed25519 signatures.
- AEAD security (IND-CPA + INT-CTXT) for AES-256-GCM.
- Computational Diffie–Hellman on Curve25519 for ECDH secrecy.
- Random-oracle modelling of SHA-256 inside HKDF proofs.

2.4 Fail-closed philosophy

Every verification in GW1 raises SecurityError and tears the link down: bad signature, wrong protocol tag, role mismatch, malformed key length, MAC mismatch, GCM tag failure, ratchet counter desynchronisation. There is no warning mode, no plaintext fallback, no ‘proceed anyway’. A link that died is information; a link that continued with weakened guarantees would be the vulnerability.

Chapter 3 — Data Representation and Framing

3.1 Byte-level conventions

- All multi-byte integers on the wire are big-endian (`struct.pack('>I', n)`); curve scalars/points are little-endian per RFC 7748/8032.
- Base64 (standard alphabet) encodes binary fields inside the JSON hello messages (`e`, `i`, `s`).
- Human-readable payloads are UTF-8; protocol control strings are ASCII.
- MAX_FRAME = 1,000,000 bytes bounds allocation attacks.

3.2 Frame layout of the transport cipher

```
sealed frame (bytes):
  +0..3    u32  ratchet counter n            (big-endian)
  +4..15   12B  nonce  = dir_byte || n (11B big-endian)
  +16..    ct   AES-256-GCM ciphertext
  last 16B tag  GCM authentication tag
```

The counter is repeated in the clear so a receiver can detect desynchronisation before spending a decryption; the nonce embeds a direction byte (first byte of the chain label) so the two directions can never mirror each other's nonces even under identical counters.

3.3 Length-prefixed transport framing

TCP and RFCOMM carry identical 4-byte big-endian length-prefixed frames. A probe frame (GW1PROBE) outside the secure session answers with the node fingerprint (GW1PONG) unless stealth mode silences it — reconnaissance data intentionally contains no secrets beyond the public fingerprint.

Chapter 4 — Randomness and Key Generation

4.1 The only entropy source

```
import os
identity_secret = os.urandom(32)      # Ed25519 seed
eph_secret      = os.urandom(32)      # X25519 scalar, per session
```

On Linux/Android `os.urandom` reads the kernel pool (getrandom(2)), which seeds ChaCha20 from interrupt timing, and blocks until initialised on modern kernels. GHOSTWIRE never seeds, never mixes, never persists. Adding custom ‘entropy sources’ is a classic way to weaken a CSPRNG and is forbidden by the maintenance guide.

4.2 Key clamping and validation

X25519 secrets are clamped per RFC 7748 (low three bits cleared, top bit set, second-top bit set) inside the ladder; Ed25519 seeds are expanded with SHA-512 and clamped per RFC 8032. Peer points are validated: 32-byte length checks, on-curve recovery failure → SecurityError; low-order point checks are inherent in the RFC 8032 verification formula used (sB = R + hA).

4.3 Key hierarchy

Key	Derivation	Lifetime
identity secret	urandom(32)	process
ephemeral scalar	urandom(32)	session
shared (ECDH)	X25519(eph, peer_eph)	session
root	HKDF(shared, 'GW1|root', salt=session_id)	session
chain c/s	HKDF(root, 'GW1|chain|' + dir)	erased per msg
msg key	HKDF(chain, 'GW1|message-key')	one frame
confirm key	HKDF(root, 'GW1|confirm')	handshake

PART II — HASHES AND MESSAGE AUTHENTICATION

Chapter 5 — SHA-256

5.1 Construction

SHA-256 (FIPS 180-4) maps arbitrary-length input to 32 bytes via Merkle–Damgård iteration over a 512-bit block function: 64 rounds mixing eight 32-bit words with the operations Ch(e,f,g)=(e∧f)⊕(¬e∧g), Maj(a,b,c), rotations σ0/σ1, and addition modulo 2^{32} against 64 round constants derived from cube roots of primes. Message schedule expands 16 words to 64 with σ0/σ1 feedback.

5.2 Security properties relied upon

- Collision resistance (~2^{128} work) — fingerprints, transcript hashes.
- Preimage resistance (~2^{256}) — session ids reveal nothing about the transcript.
- PRF-like behaviour when keyed via HMAC (Chapter 6).

5.3 Uses inside GW1

- Identity fingerprints: uppercase hex of SHA-256(public key), grouped 4-4-4-4, for out-of-band comparison.
- Transcript hash: incremental `hashlib.sha256` absorbing both signed hello payloads; the digest becomes the session id and the HKDF salt.
- HKDF and HMAC inner hash (Chapters 6–7).

5.4 Implementation notes

The host CPU path uses the platform's optimised hashlib (SHA-NI on x86, ARMv8 crypto extensions on Android). No pure-Python SHA-256 is shipped; there is no reason to re-implement a primitive the silicon already accelerates. Maintenance rule: never replace hashlib with a third-party hash implementation.

Chapter 6 — HMAC-SHA256

6.1 Definition

HMAC(K, m) = H((K'⊕opad) || H((K'⊕ipad) || m)) with K' the key padded to the block size (or hashed if longer). It turns SHA-256 into a keyed PRF with a security proof reducible to the compression function's PRF-ness.

6.2 Role in GW1: key confirmation

After deriving the root key, each side computes `confirm_mac(role) = HMAC(HKDF(root, 'GW1|confirm'), role)` and exchanges them before any traffic. This converts the implicit key authentication of ECDH into explicit entity-binding: an active attacker who cannot compute the MAC cannot finish the handshake, and a reflection is impossible because the role string differs per direction. Comparison uses `hmac.compare_digest` for constant time.

6.3 Constant-time discipline

All equality tests over authenticators (confirmation MACs, and by extension GCM tags inside the AEAD library) go through constant-time comparison. The maintenance guide forbids `==` on any value whose equality leaks key material timing.

Chapter 7 — HKDF and Domain Separation

7.1 RFC 5869 structure

HKDF = Extract(salt, IKM) → PRK, then Expand(PRK, info, L). With SHA-256, Extract is HMAC(salt, IKM) and Expand iterates HMAC(PRK, prev || info || i). GHOSTWIRE uses the PyCryptodome implementation: `HKDF(ikm, length, salt, SHA256, 1, context=info)`.

7.2 Why the salt is the session id

Salting the root derivation with the full transcript hash binds the key to the exact pair of hellos that were signed. Two sessions that ever differed in one byte of hello produce disjoint key material even under identical ECDH output — a belt-and-braces binding on top of including the transcript in the signed payloads.

7.3 The info strings (domain separation table)

info string	output	purpose
GW1|root	root key	session root from ECDH
GW1|chain|c2s	client chain	client→server ratchet seed
GW1|chain|s2c	server chain	server→client ratchet seed
GW1|message-key	32B	per-frame AES-256 key
GW1|ratchet-step	32B	next chain state (erases old)
GW1|confirm	32B	confirmation MAC key

Distinct info strings make every derived key an independent random oracle output; reusing one string for two purposes is the single most common HKDF deployment bug and is structurally impossible here because the table is enforced in code (Chapter 20).

PART III — SYMMETRIC ENCRYPTION

Chapter 8 — AES-256

8.1 The block cipher

AES-256 (FIPS 197) is a 14-round substitution–permutation network over a 4×4 byte state: AddRoundKey, SubBytes (the GF(2^8) inverse S-box), ShiftRows, MixColumns (multiplication by the polynomial x^3+x+1... $x^3+\{01\}$... $c(x)=03x^3+01x^2+01x+02$ in the standard ordering). The 256-bit key schedule expands to 15 round keys with an extra SubWord step every fourth round.

8.2 Why 256

AES-128 would suffice against classical adversaries, but the 256-bit key lifts Grover-bounded quantum search to $\sim 2^{128}$ and buys margin against related-key and future analytic progress at negligible cost on ARMv8 crypto extensions. The choice is deliberate conservatism for a tool whose traffic may be stored for decades.

8.3 Where it runs

All AES in the shipped builds executes inside PyCryptodome's C core (`_raw_aes.abi3.so`), cross-compiled by python-for-android with the NDK and verified ARM64 in the APK bundle (Chapter 22). The Python layer never touches rounds; it only passes key/nonce/AAD and checks tags.

Chapter 9 — Galois/Counter Mode

9.1 Construction

GCM encrypts with CTR (counter block = 96-bit nonce || 32-bit counter starting at 2 for data, 1 reserved for the tag key H = E_K(0^{128})) and authenticates AAD and ciphertext with GHASH, a multiplication hash in GF(2^{128}) modulo $x^{128}+x^7+x^2+x+1$. The tag is GHASH ⊕ E_K(nonce||1).

9.2 Parameters fixed by GW1

Parameter	Value	Rationale
key	32B (AES-256)	§8.2
nonce	12B = dir || counter(11B)	uniqueness by construction
tag	16B	full-width; 2^{-128} forgery bound
AAD	b'GW1'	binds frames to protocol

9.3 The nonce-reuse catastrophe and its structural prevention

Reusing (key, nonce) in GCM leaks the XOR of plaintexts and — worse — the authentication subkey H, enabling universal forgeries. GW1 removes the hazard by construction: keys are fresh per message from the ratchet, and even within one key the nonce embeds the monotonic message counter and a direction byte. Nonce management is therefore not a runtime responsibility at all — it is a property of the key derivation.

9.4 Verification behaviour

`decrypt_and_verify` raises on any tag mismatch; GW1 maps every such failure to SecurityError('AES-GCM authentication failed') and kills the link. Truncated frames (< 4+12+16 bytes) are rejected before any cryptographic operation (Chapter 20).

Chapter 10 — Symmetric-Hash Ratchets and Per-Message Forward Secrecy

10.1 Chain mechanics

```
chain_0      = HKDF(root, 'GW1|chain|' + direction)
msg_key_n    = HKDF(chain_n, 'GW1|message-key')
chain_{n+1}  = HKDF(chain_n, 'GW1|ratchet-step')
# chain_n is then overwritten: old state deleted
```

Each direction owns an independent chain. Because chain_{n+1} is a one-way hash step of chain_n, learning chain at time t yields no chain state before t, hence no earlier message keys: per-message forward secrecy without the bookkeeping of a full Double Ratchet.

10.2 Synchronisation and fail-closed desync

The receiver expects counter n+1 exactly; any other counter means a dropped, injected or replayed frame, and the link is torn down rather than resynchronised. For a telemetry/messenger tool over reliable streams (TCP/RFCOMM) in-order delivery is guaranteed, so strict monotonicity is free integrity.

10.3 Comparison with the Double Ratchet

Signal's Double Ratchet adds out-of-order tolerance and post-compromise healing via DH ratchet steps. GW1 trades those for simplicity and deterministic fail-closed behaviour on transports that already order bytes; post-compromise healing is approximated by transience (burn-after-read) instead of ratchet mechanics. The trade-off is documented here so maintainers do not ‘fix’ the desync behaviour into a resynchronisation — doing so would create a replay oracle.

10.4 Erasure guarantees

Python cannot promise RAM zeroisation (the interpreter may have copied bytes), but re-binding `self.chain` drops the only reference the program keeps; CPython frees the buffer promptly under reference counting. The guarantee is therefore: no *program-visible* old state survives a step, which is the honest claim the UI makes (‘keys rotated’).

PART IV — PUBLIC-KEY PRIMITIVES

Chapter 11 — Elliptic Curve Primer

An elliptic curve over a prime field is the set of solutions to a cubic equation together with a group law: the chord-and-tangent rule. GHOSTWIRE uses the curve birationally equivalent to Edwards25519 via its Montgomery form Curve25519: $y^2 + x^2 = 1 - 121665/121666 \cdot x^2y^2$ (Edwards, $d = -121665 \cdot 121666^{-1} \bmod p$) with $p = 2^{255} - 19$. The group order is $8 \cdot \ell$ with $\ell = 2^{252} + 27742317777372353535851937790883648493$ prime.

11.1 Why 25519

- A 2^5-scale prime shaped for fast reduction ($2^{255}-19$).
- A complete(ish) addition law in Edwards coordinates: unified formulas resist timing channels.
- 128-bit security with 32-byte keys — half the size of P-256 encodings for signatures.
- RFCs 7748/8032 give byte-exact, test-vectored specifications.

11.2 The two problems assumed hard

Discrete logarithm in the prime-order subgroup (best generic attack Pollard-rho $\approx 2^{126}$ group ops) underlies both X25519 secrecy (Computational DH) and Ed25519 unforgeability.

Chapter 12 — X25519 Diffie–Hellman

12.1 The Montgomery ladder

Scalar multiplication on the u-line uses only the u-coordinate: differential additions and doublings on the pair $(x_2,z_2),(x_3,z_3)$. The ladder processes bits top-down with a constant-time conditional swap (cswap), so the sequence of field operations is identical for every scalar — no branch depends on the key.

```
# gw/_curve25519.py — ladder core (see Chapter 19 for the
# annotated full listing)
for t in range(254, -1, -1):
    bit = (k >> t) & 1
    x2, x3 = cswap(swap ^ bit, x2, x3)
    ...
    x2 = AA * BB
    z2 = E * (AA + 121665 * E)
```

12.2 Clamping

The RFC 7748 clamp (k &= ~7; k |= 2^{254}) clears the cofactor bits and fixes the top bit, making the operation cofactor-safe and ladder-stable. GW1 clamps on every use; peer u-coordinates are accepted as arbitrary field elements — the ladder is total, and small-subgroup inputs yield the all-zero shared secret which HKDF then treats as fixed public material; authentication (signatures + MACs) is what kills such peers, not point validation.

12.3 Correctness vectors

Appendix A reproduces RFC 7748 §6.1 and adds 300 generated ladder vectors; the validator (Appendix B) re-derives them on device at maintenance time.

Chapter 13 — Ed25519 Signatures

13.1 Signing

The seed expands via SHA-512 into a clamped scalar a and a prefix; the nonce r = H(prefix || m) mod ℓ makes signing deterministic (no RNG failure mode); R = rB; h = H(R || A || m) mod ℓ; s = r + h·a. The signature is R || s (64 bytes).

13.2 Verification

The check sB = R + hA is performed in extended twisted-Edwards coordinates with a double-and-add scalar multiplier; point decompression recovers x from y with the sign bit, rejecting non-residues. This is exactly the RFC 8032 verification equation — it subsumes cofactor and small-order checks for GW1's purposes.

13.3 Determinism as a feature

Deterministic nonces remove the single largest real-world EdDSA/ECDSA failure class (biased or repeated nonces leaking keys). Two signatures of the same message are identical — acceptable here because messages already carry fresh transcripts.

13.4 Usage in GW1

Identities sign exactly one payload shape: `GW1|role|eph_b64|id_b64|bind`. The responder's `bind` field contains the initiator's hello signature, making the server signature untransferable between candidate sessions and yielding the SIGMA property that the key is bound to both identities and both ephemerals.

Chapter 14 — Pure-Python Cryptography on Android: A Case Study

14.1 The incident

The first Android builds used the `cryptography` package. Its Rust extension (`_rust.abi3.so`) cross-compiled cleanly and was a valid ARM64 ELF, yet at import time Android's linker failed: `cannot locate symbol "PyExc_TypeError"`. Stable-ABI (abi3) modules resolve CPython symbols from the embedding process at load; the SDL2 bootstrap embeds Python in a way that leaves those symbols unexported to dlopen'd abi3 libraries. Result: a perfectly built binary that can never load.

14.2 The fix

Two-layer substitution: (1) AES/HKDF moved to PyCryptodome, whose C modules are ordinary (non-abi3) extensions linked during the p4a build and loaded without symbol interposition problems; (2) X25519/Ed25519 moved to the pure-Python `gw/_curve25519.py` — interpreter bytecode cannot fail to dlopen. Performance: a full handshake (two ladders, three Ed operations) completes in well under a second on modern ARM cores and ~60 ms on the development host; per-session cost, irrelevant for telemetry cadence.

14.3 Lessons codified as maintenance rules

- Never introduce an abi3/Rust extension into the Android bundle without an on-device import test.
- Prefer primitives whose failure mode is a Python exception over ones whose failure mode is a linker abort.
- Keep a generated vector corpus (Appendix A) so a pure-Python core is re-proven correct at every release.

PART V — THE GW1 PROTOCOL

Chapter 15 — Protocol Overview and Session Lifecycle

15.1 Roles and states

Every node owns one long-term identity. A session has a client and a server; either may initiate the TCP connection (roles refer to the handshake, not to who dialed). The lifecycle is: probe (optional) → hellos → derive → confirm → traffic → burn/close.

```
CLIENT                          SERVER
  |-- hello(role=client) -------->|   signed(e_c, id_c)
  |<-- hello(role=server,         |   signed(e_s, id_s,
  |        bind=sig_c)            |          bind=sig_c)
  |    derive() on both sides     |
  |-- confirm_mac('client') ----->|
  |<-- confirm_mac('server') -----|
  |======= ratcheted frames =====>|
```

15.2 Session identity

session_id = SHA-256 over the running transcript initialised with 'GW1|session|v1' and updated with both hello payloads. It is displayed to operators and used as the HKDF salt, so a session is cryptographically bound to what both screens show.

Chapter 16 — The Handshake, Annotated

16.1 Hello payload

```
payload = f"{PROTOCOL}|{role}|{e_b64}|{i_b64}|{bind}"
sig     = Ed25519.sign(identity_secret, payload)
msg     = {"t":"hello","role":role,"e":e_b64,
           "i":i_b64,"s":b64(sig),"v":"GW1"}
```

Signing the base64 forms (not the raw bytes) makes the signed string exactly the transmitted string — no canonical-isation gap for an attacker to exploit.

16.2 Verification steps (consume_hello)

- role ≠ own role and ∈ {client, server} — else SecurityError.
- v == 'GW1' — version pin.
- Ed25519.verify(peer_id, sig, rebuilt payload) — EUF-CMA.
- transcript.update(payload) — order fixed by role.

16.3 Derivation and confirmation

derive() performs the ladder, hashes the transcript to the session id, and HKDFs the root. confirm_mac binds role strings; check_confirm uses compare_digest. Only after both confirmations does the link construct its two CipherStates — traffic before confirmation is impossible by construction.

16.4 Attack walkthroughs

Attack	Defeated by
passive read of hellos	ECDH secrecy + signatures add nothing usable
hello replay	fresh ephemerals; transcript-bound sigs
relay/MITM	signatures over both ids and ephs; bind
unknown-key-share	id included in signed payload
reflection	role string inside payload and MAC

Chapter 17 — Transport Cipher, Framing and Transience

17.1 Frame production

send: step the tx chain → AES-256-GCM(msg key, nonce, AAD='GW1') → frame = n || nonce || ct||tag. receive: parse, check counter, step the rx chain, verify+decrypt. Any exception → SecurityError → link death.

17.2 TTL and burn-after-read

Every chat frame carries a TTL chosen from the operator presets (60 s default, then 90 s / 120 s / 180 s / 300 s — shown on the fire button as 60s, 1.5m, 2m, 3m, 5m). On display the receiver sends a `seen` control frame; both peers count down and delete at zero; a `burned` frame confirms bilateral deletion. `delete-forever` burns immediately. Messages are never written to disk — the UI holds them only in widget state and removes them from memory on burn.

17.3 Control frames

- seen / burned / delete-forever — transience protocol.
- All control frames use the same ratchet; they are ciphertext like everything else.

Chapter 18 — Discovery, Transports and Failure Handling

18.1 Discovery

A sweep connects to candidate addresses and sends GW1PROBE; a node answers GW1PONG + hex fingerprint unless stealth mode is armed (then silence). The probe reveals nothing secret; the fingerprint is public by design (it is what operators compare out-of-band).

18.2 Transports

TCP (Wi-Fi/LAN) and Bluetooth RFCOMM share the byte-identical protocol; SecureLink wraps any bidirectional byte pipe. Android requires BLUETOOTH_CONNECT/SCAN at runtime; the manifest requests them (Chapter 22).

18.3 Failure taxonomy

Condition	Class	Action
bad signature	SecurityError	close link
version/role mismatch	SecurityError	close link
MAC mismatch	SecurityError	close link
GCM tag fail	SecurityError	close link
counter desync	SecurityError	close link
socket error	LinkClosed	UI reports peer lost

PART VI — SOURCE CODE, ANNOTATED

This part prints the exact source shipped in release 1.1.0. Code is authoritative; prose elsewhere in the book merely explains it.

Chapter 19 — gw/_curve25519.py (Pure-Python Core)

The complete interpreter-only implementation of RFC 7748 and RFC 8032. Field arithmetic is integer arithmetic modulo $2^{255}-19$; inversion uses Fermat exponentiation; the ladder and the Edwards multiplier are written for clarity and constant *sequence* (not constant *time* — CPython bigint ops are not timing-constant, an accepted residual noted in §14.3 for a local-telemetry threat model).

19.1 Constants and field helpers

```
"""Pure-Python X25519 / Ed25519 for GHOSTWIRE.

References:
  * X25519: RFC 7748, based on djb's public-domain reference design.
  * Ed25519: RFC 8032 (python "ed25519" reference implementation design,
    public domain, as published on ed25519.cr.yp.to).

Rationale: zero native extension modules -> nothing can fail to dlopen
inside the python-for-android bundle.  The handshake performs only a
handful of scalar multiplications per session, so interpreter speed is
perfectly adequate for a telemetry app.
"""

Chapter 20 — gw/crypto.py (Protocol Cryptography)

Composition layer: identity, handshake, ratchet, AEAD. Nothing here is invented; every call maps to a primitive specified in Parts II–IV.

20.1 Header, constants, helpers

```
"""GHOSTWIRE crypto core.

Design (SIGMA-style authenticated ECDH + ratcheted AES-GCM):

1. Each node owns a long-term Ed25519 *identity key* (used only to sign).
2. Per session, both peers generate fresh ephemeral X25519 keypairs.
3. Hellos are signed: the server's signature additionally binds the
   client's hello, so transcripts cannot be relayed or rebound.
4. Shared secret = X25519(eph, peer_eph).  A root key is derived with
   HKDF-SHA256 salted by the full transcript hash (session id).
5. Two independent symmetric ratchet chains (one per direction) derive a
   FRESH AES-256-GCM key for every single message and then delete the
   previous chain state -> forward secrecy at message granularity.
6. Both sides exchange HMAC key-confirmation MACs before any traffic is
   accepted, so an active attacker cannot complete a session with a
   mismatched key.

Implementation notes (Android build):
  * AES-256-GCM + HKDF come from PyCryptodome, which cross-compiles
    cleanly inside the python-for-android SDL2 bundle.
  * X25519 / Ed25519 use the pure-Python implementations in
    ``gw._curve25519`` (RFC 7748 / RFC 8032 designs).  They run a few
    scalar multiplications per session, and being interpreter-only they
    can never fail with a native dlopen error on Android.

            raise SecurityError("AES-GCM authentication failed") from exc
```

20.5 Invariants enforced by this file

- No `==` on authenticators; compare_digest only.
- Length checks before every curve operation.
- Every failure path raises SecurityError; callers never see raw crypto exceptions.
- info strings and AAD are literals — domain separation cannot drift.

Chapter 21 — gw/net.py (Secure Link and Node)

The network layer wraps any byte pipe in the GW1 handshake and ratchet. Printed below are the security-relevant sections; UI glue is omitted.

21.1 SecureLink

```
class SecureLink:
    """A single encrypted channel over a connected stream socket."""

    def __init__(self, sock, identity: Identity, role: str, status=None):
        self.sock = sock

# ---------------------------------------------------------------------
# Node server (TCP)
# ---------------------------------------------------------------------
```

21.2 NodeServer (accept + probe)

```
class NodeServer:
    """GW1 listener with OPERATOR-GATED, strictly peer-to-peer access.

    The node hosts ONE secure link at a time (two parties, no more).
    Every inbound connection that is not a reconnaissance probe is
    parked at a request gate: the operator is shown
    "<ip:port> REQUESTS A CHAT" and must ACKNOWLEDGE before the GW1
    handshake may even begin; REJECT (or a 60 s timeout) closes the
    socket.  Acknowledging while a peer is connected drops that peer
    first — a third device can therefore never silently displace an
    active client."""

    REQUEST_TIMEOUT = 60.0   # operator decision window (seconds)

    def __init__(self, identity: Identity, on_link=None, on_request=None,
                 status=None):
        self.identity = identity
        self.on_link = on_link
        self.on_request = on_request
        self.status = status or (lambda s: None)
        self.stealth = False
        self.listening = False
        self.bound = None
        self.sock = None

            except OSError:
                break
            threading.Thread(target=self._handle, args=(conn, addr),
                             daemon=True).start()

    def _handle(self, conn, addr) -> None:
        conn.settimeout(15)
        try:
            head = conn.recv(8, socket.MSG_PEEK)
        except OSError:
            conn.close()
            return
        if head.startswith(MAGIC_PROBE):
            # Reconnaissance probe.  Stealth nodes stay silent.
            try:
                conn.recv(64)
                if not self.stealth:
                    fp = self.identity.fingerprint.replace(" ", "")
                    conn.sendall(MAGIC_PONG + b" " + fp.encode())
            except OSError:
                pass
            conn.close()
            return
        # -- everything else must pass the operator gate first
        label = f"{addr[0]}:{addr[1]}"
        self.status(f"INBOUND REQUEST ({label})")
        if not self._hold_for_decision(label):
            conn.close()
            return
        # Acknowledged: peer-to-peer means one live peer — drop the old.
        with self._lock:
            old = self.link
            self.link = None
        if old is not None and old.alive:
            old.close()
        link = SecureLink(conn, self.identity, "server", status=self.status)
```

Note the accept loop peeks 8 bytes: GW1PROBE takes the reconnaissance path (respecting stealth); anything else becomes a handshake candidate with a 15 s timeout — resource exhaustion is bounded by daemon-thread-per-connection under the OS backlog.

Chapter 22 — Packaging and Platform Security

22.1 buildozer.spec (shipped)

buildozer.spec

```
[app]
title = GHOSTWIRE
package.name = ghostwire
package.domain = org.ghostwire
version = 1.1.0

source.dir = .
source.include_exts = py,png
source.exclude_dirs = shots,.buildozer,.git,__pycache__,docs
source.exclude_patterns = test_v110.py,test_multilink.py

requirements = python3,kivy==2.3.1,kivymd==1.2.0,pycryptodome

orientation = portrait
fullscreen = 0

icon.filename = ./icon.png
android.presplash_color = #0B0E0B
android.presplash_lottie = ./presplash.json
android.allow_backup = False

android.api = 34
android.minapi = 24
android.archs = arm64-v8a

android.permissions = INTERNET,ACCESS_NETWORK_STATE,ACCESS_WIFI_STATE,BLUETOOTH,BLUETOOT
      H_ADMIN,BLUETOOTH_CONNECT,BLUETOOTH_SCAN

# p4a / build
p4a.bootstrap = sdl2
android.entrypoint = org.kivy.android.PythonActivity

[buildozer]
log_level = 2
warn_on_root = 0
```

22.2 Security-relevant manifest properties

- android:windowSoftInputMode="adjustPan" — UX hardening (keyboard without GL-surface churn).
- android:allowBackup="false" — no key/material exfiltration via ADB backup.
- targetSdkVersion 34 / minSdk 24 — modern permission and runtime model, broad device floor.
- Permissions limited to INTERNET, network state and the four BLUETOOTH_* grants the RFCOMM transport requires.

22.3 Bundle composition verified at release

- libpybundle.so: gzip tar of _python_bundle (stdlib + site-packages) — audited for arch (aarch64) and content.
- PyCryptodome _raw_*.abi3.so built by the NDK, not abi3-against a foreign interpreter (Chapter 14).
- No cryptography/Rust artifacts shipped.

PART VII — MAINTENANCE & OPERATIONS

Chapter 23 — Maintenance and Upgrade Guide

23.1 Dependency matrix

Component	Pinned	Role	Upgrade trigger
python3 (p4a)	3.14.x	runtime	security release
kivy	2.3.1	UI/window	API need / CVE
kivymd	1.2.0	widgets	kivy compat
pycryptodome	3.23.0	AES/HKDF	CVE in AES/GCM/KDF
NDK	r28c	cross-compile	p4a support
android.api	34	target SDK	Play policy / yearly

23.2 Standard upgrade procedure

• 1. Bump the pin in buildozer.spec on a branch; read the upstream changelog for ABI breaks.

• 2. `buildozer android clean` only when the recipe chain changed; otherwise incremental dist rebuild.

• 3. Run the host validation suite (Appendix B) — it must pass 100% before any device test.

• 4. Build, then verify the bundle: aarch64 .so set, no forbidden artifacts (§22.3), manifest invariants.

• 5. On-device: cold boot (presplash→splash→home), deploy node, sweep, connect, chat, burn, keyboard open/close.

• 6. Tag release; regenerate this book (its vectors are produced by the same validator).

23.3 What must NEVER change without a protocol review

• Any info string, AAD, or payload grammar (domain separation).

• Counter/nonce layout in CipherState (framing compat).

• The fail-closed desync behaviour (§10.2).

• Introduction of any native extension (Chapter 14).

Chapter 24 — Validation and Testing

24.1 The three-tier suite

• Tier 1 — published vectors: RFC 7748/8032, RFC 5869, NIST GCM; run at import of the validator.

• Tier 2 — generated corpus (Appendix A): 2,000+ derived vectors tying this exact code to reproducible outputs.

• Tier 3 — property tests: handshake symmetry, tamper detection, replay/desync death, TTL burn bilateral.

24.2 On-device acceptance checklist

• logcat shows 'SECURE LINK ESTABLISHED' on both ends with matching peer fingerprints.

• A third laptop running the probe sees only GW1PONG + fingerprint (or silence in stealth).

• Killing one peer mid-chat produces LinkClosed, never plaintext or hang.

• Burn timer deletes on both devices; process memory scan after burn finds no message string.

Chapter 25 — Incident Response and Operational Discipline

25.1 Fingerprint verification SOP

Before classified traffic, operators read the 16-hex fingerprint aloud or via a second channel and compare both directions. A mismatch means an active MITM right now; abort, do not ‘retry’.

25.2 Compromised-device playbook

- Assume all identities on that device are burned; generate a new identity (restart) and re-verify fingerprints.
- Old sessions retain per-message forward secrecy, but transience is the real control: everything was burned already.
- Rotate nothing else — keys are ephemeral by design.

25.3 Honest threat notes (operator-facing)

No anonymity; no post-quantum KEM; a rooted endpoint reads plaintext. The app states this on its own Security screen; this chapter is the long form of that banner. GHOSTWIRE protects the channel, not the endpoints.

PART VIII — FIELD OPERATIONS

Parts I–VII describe what GHOSTWIRE is; this part describes how it is used, where it is strong, where it is honestly weak, and under what conditions it can be operated beyond a local network segment.

Chapter 26 — Operating GHOSTWIRE

This chapter is the operator's manual. It follows the exact screen flow of release 1.1.0 on Android 10+. The same modules run unmodified on desktop Python for testing.

26.1 Requirements and installation

- Android 10 or newer (minSdk 24, targetSdk 34); the debug APK installs without Play-Store warnings.
- No permissions beyond INTERNET, network state and the four BLUETOOTH_* grants needed by the RFCOMM transport.
- Desktop testing: CPython 3.10+, PyCryptodome, Kivy/KivyMD; the crypto core itself has zero GUI dependencies and runs under bare interpreter.
- Two devices are the minimum useful deployment: one deploys a node, the other initiates the uplink.

26.2 First boot and the splash

Boot plays the animated splash (the presplash continues the same animation so there is no visual seam), shows the GHOSTWIRE wordmark and the credits line DEVELOPED BY @Ariko & Arena, then lands on the home screen. Nothing is transmitted at boot; identities are generated locally and no network socket is opened until the operator acts.

26.3 Home screen — NODE CONTROL

The home screen carries the NODE CONTROL card. Fields and their effects:

control	default	effect
BIND ADDR	0.0.0.0	Interface to listen on. 0.0.0.0 = every interface; pin to a specific address to expose the node on one NIC only.
PORT	9999	TCP port for the GW1 listener.
DEPLOY NODE / STOW NODE	—	Toggles the GW1 listener thread. Status line reads OFFLINE or reports the bound address while deployed.
SITREP panel	—	Session state: active link, peer, session id, transport counters.
shield-lock (top bar)	—	Opens the SECURITY PROTOCOLS screen (Chapter 26.7).

Deploying a node does not contact anyone; it binds, listens (backlog 8) and waits. Incoming connections are triaged by peeking the first 8 bytes: GW1PROBE traffic takes the reconnaissance path, anything else enters the 15-second handshake window. Failed handshakes close the socket and log the rejection class — the node never reveals why.

A deployed node hosts MULTIPLE simultaneous secure links (MAX_PEERS = 8 on TCP, 4 on RFCOMM). Every accepted connection performs its own independent handshake and gets its own ratchet pair, reader thread and conversation on the operator's screen; a hard cap bounds resource exposure and refuses the excess with SESSION LIMIT REACHED. The outbound side is symmetric: the device may hold several uplinks at once. Each channel is cryptographically isolated — separate ephemeral keys, separate roots, separate chains.

26.4 ESTABLISH UPLINK — initiating a session

The connect screen collects the target and transport, then drives the handshake with a live console:

field / action	meaning
TARGET HOST / IP	Hostname or IP of the remote node.
TARGET PORT	Remote GW1 port (default 9999).
WIFI / LAN	TCP transport over IP — LAN or, with routing in place, WAN (Chapter 28).
BLUETOOTH RFCOMM	The identical GW1 protocol over an RFCOMM socket (channel 7); the target becomes a BD_ADDR.
INITIATE HANDSHAKE	Runs the client side of §4: hello exchange, signature verification, ECDH, ratchet online, key confirmation.
DROP	Tears the link down; ratchet state is discarded.
HANDSHAKE CONSOLE	Line-by-line status of every handshake phase, including the exact SecurityError on failure.

The console also prints the local identity fingerprint at startup. A successful uplink ends with SECURE LINK ESTABLISHED and the session id; from that moment every character typed is sealed with a fresh AES-256-GCM key.

26.5 Discovery — the SCAN screen

SCAN sweeps a target range with capped breadth (at most 1024 hosts per sweep, connect timeout 0.35 s, probe timeout 1.0 s). The results list admits ONLY hosts that answer GW1PROBE with a valid GW1PONG fingerprint: open ports with no GW1 answer are silently ignored, since listing them would expose the very stealth nodes the operator is entitled to hide. Each reachable GW1 node answers with its identity fingerprint unless its operator has enabled stealth, in which case it stays silent and simply does not appear. Sweeps are stoppable mid-run. Treat sweep results as hints only: absence of a pong is not proof of absence.

26.6 CHAT — the secure channel

The chat header shows the endpoint and the peer fingerprint; the banner reminds of the guarantees in force: AES-256-GCM E2E, ratcheted keys, burn after read. When the node hosts several peers, the SESSION strip under the banner lists one chip per live channel — direction glyph (inbound/outbound), peer fingerprint, and an unread counter for channels that received traffic while backgrounded. Tapping a chip swaps the whole conversation view; every session keeps its own message list, and the security screen follows the active session.

- shield-check — opens the verification dialog: compare the peer fingerprint (and, verbally, the session id) over an independent channel. This is the MITM tripwire; do it once per session.
- delete-forever — BURN: bilateral self-destruct of the active conversation on both devices; message objects carry TTL and are not persisted between runs by design.
- link-variant-off — DROP ALL: terminates every live channel at once.
- power — disconnect the ACTIVE channel only; the others stay up. Keys die with their link.
- Delivery state travels as authenticated ack/del objects per channel, so both screens agree on what was actually received.

26.7 SECURITY PROTOCOLS screen

Read-only transparency panel: the full cipher suite in force (X25519 ephemeral KEX, Ed25519 mutual signatures, HKDF + symmetric ratchet, AES-256-GCM, HMAC key confirmation, bilateral burn), the live session id and the peer fingerprint. If any line does not match this book, stop and investigate — the code is the spec.

26.8 Typical session, start to finish

1. Operator A deploys a node (home → DEPLOY NODE). 2. Operator B scans the segment or is told the address, opens ESTABLISH UPLINK and initiates the handshake. 3. A's screen raises the INBOUND REQUEST dialog; A taps ACKNOWLEDGE and the handshake proceeds. 4. Both consoles report SECURE LINK ESTABLISHED with the same session id. 5. Both compare fingerprints via the verify dialog. 6. Chat; the selected TTL bounds each message's lifetime. 7. Either party burns or disconnects; nothing useful remains in memory afterwards.

26.9 Troubleshooting

symptom	likely cause	remedy
HANDSHAKE REJECTED (SecurityError)	tampered or replayed hello, version mismatch, role confusion	do not retry blindly; verify addresses and fingerprints out-of-band
identity signature check failed	wrong/stale peer key or MITM substitution	compare fingerprints; abort if they differ
key confirmation MAC mismatch	peers derived different roots — active interference or bug	abort; treat as attack
no pong in SCAN	stealth node, firewall, wrong port	connect directly by address
connection refused on WAN host	NAT without port forward	Chapter 28.3
ratchet sequence desync	byte-pipe corruption or a middlebox replaying frames	re-key by reconnecting

Chapter 27 — Strengths and Limitations

An honest ledger. Marketing copy is elsewhere; this chapter is what a reviewer should hold the design against.

27.1 Strengths

• Mutual authentication by construction: both hellos signed, server hello transcript-bound; no password, no PKI, no trust-on-first-use leap of faith.

• Explicit key confirmation before the first byte of traffic — a mismatched key can never silently carry messages.

• Forward secrecy at message granularity: compromising the process mid-session exposes only future frames.

• Strict sequencing rejects replay, reordering and injection outright rather than buffering them.

• Fail-closed everywhere: every parse and verification failure is a SecurityError with a precise message — no warning-only paths, no crypto silently skipped.

• Fully auditable on the target platform: the public-key core is 195 lines of pure Python printed in Chapter 19; there is no opaque native code on the trust path.

• Stealth discipline: probes leak no protocol state, and a stealth node leaks nothing at all.

• Bilateral burn plus no-at-rest storage: conversation state is deliberately ephemeral.

27.2 Limitations — by design

• Endpoint trust: a seized unlocked device ends every guarantee. GW1 protects the wire, not the endpoints.

• Strictly two-party: one node, one live link, no group ratchet. The request gate (Chapter 26.3) enforces this socially as well as technically — every connection is an acknowledged decision.

• Synchronous by design: no store-and-forward, no offline delivery, no message history. Both parties must be online simultaneously.

• Strict counters mean no multipath and no lossy-pipe tolerance: GW1 assumes TCP (or RFCOMM) ordering and treats gaps as attacks.

• Identity keys are generated per install and not exported. Reinstall means a new fingerprint — expected, but operators must re-verify peers afterwards.

• Pure-Python curve arithmetic is not constant-time; remote sub-microsecond timing attacks are out of the threat model, and the book says so wherever it matters (§14.3).

27.3 Limitations — of the medium

• Metadata is exposed: who connects to whom, when, and how much. Frame lengths are padded only by the JSON payload shape, not to fixed sizes.

• An open GW1 port is detectable by port scanning even when stealth hides the protocol banner.

• No post-quantum component: a harvest-now-decrypt-later adversary with a future CRQC could recover recorded sessions (transcripts contain no long-term secrets, so the window is the recording window — but it is not zero).

• Throughput is messenger-scale, not file-transfer-scale: the per-message HKDF step and pure-Python signing bound handshake rate, not message rate, but bulk transfer was never the intent.

27.4 Positioning

GW1 is strongest exactly where it was aimed: short-lived, high-value conversations between two operators who can compare fingerprints, on networks they do not control. It is deliberately not a general-purpose chat platform, and its gaps (groups, offline, history, PQ) are the price of being fully auditable in under 900 lines of protocol code.

Chapter 28 — Wide-Area (WAN) Operation

Question operators ask first: can this cross the internet, not just the room? Answer: yes — the cryptographic layer is WAN-transparent — with three caveats about reachability, discovery and metadata.

28.1 Why the protocol itself is WAN-ready

• GW1 needs only an ordered, reliable byte pipe. TCP gives that across any number of hops; the strict counter discipline (§7.2) is satisfied by TCP ordering guarantees.

• The handshake is four short messages (hello, hello, confirm, confirm). Latency adds delay, not fragility: a 300 ms round trip costs ~1.2 s of setup, once.

• Mutual authentication matters more on WAN, not less — and GW1 already performs it. There is no TLS underneath and none is needed: identity signatures plus key confirmation provide the equivalent guarantees end-to-end.

• The RFCOMM transport is the same code over Bluetooth; WAN operation changes nothing in gw/crypto.py.

28.2 LAN versus WAN, honestly compared

concern	LAN	WAN
reachability	direct IP on the segment	needs routable address (public IP, port forward, tunnel)
discovery	SCAN sweep finds nodes	sweeps are meaningless — address must be arranged out-of-band
handshake cost	milliseconds	four round trips of WAN latency
fingerprint check	can be visual/verbal in person	must use an independent trusted channel
observer	segment-local	global passive observer; metadata exposure grows
stealth value	hides banner from sweeps	open port still visible to scanners

28.3 Making a node reachable

Choose one, in order of preference:

• Opaque relay (relay_server.py, shipped) — run 'python3 relay_server.py --host 0.0.0.0 --port 9999' on any host both devices can reach, then dial that host with the WAN RELAY transport on both phones. The relay pairs dialers two at a time, tells the first 'you are the server seat' and the second 'you are the client seat', and pipes bytes until either side hangs up. It is blind by construction: no GW1 parsing, no keys — handshakes and messages cross as opaque ciphertext — so it can neither read nor forge traffic. Only addresses, pairing times and byte counts are visible to it.

• Direct public address — the node binds 0.0.0.0:9999 and is reached at its public IP. Simplest; expose only the one port.

• Port forwarding — behind NAT, forward external TCP port to the device's LAN address. The GW1 listener is indifferent to being behind NAT; only the initiator needs the mapped

address.

• Reverse tunnel — when neither side controls the edge (both behind NAT), run the node behind an outbound tunnel to a rendezvous host both operators can reach. GW1 rides the tunnel unmodified; the tunnel is a pipe, not a trust dependency — it cannot read the traffic.

Not provided by design: NAT hole-punching and rendezvous infrastructure. Adding third parties to a protocol whose central promise is that there are none is not done lightly — which is exactly why the shipped relay is blind by construction and operator-controlled. A tunnel or relay the operators run themselves keeps that promise; a vendor relay would break it.

28.4 WAN deployment patterns

• Fixed node + roaming operator: one device with stable reachability (home server, VPS tunnel endpoint) holds the node; the second device initiates from anywhere.

• Scheduled windows: because sessions are synchronous, operators agree on times; the node can be deployed only during the window and stowed afterwards, shrinking the exposure interval.

• Bluetooth fallback: if WAN reachability fails or is suspected compromised, the RFCOMM transport gives a zero-infrastructure path within radio range.

28.5 WAN-specific threats and responses

threat	status
active MITM on the path	defeated — hello signatures + key confirmation (§4, §6); fingerprint comparison is the human backstop
passive content recovery	defeated — AEAD + per-message forward secrecy (§5, §8)
malicious or seized relay host	content still defeated — the relay holds no keys (§28.3); metadata (who, when, how much) and denial-of-service remain exposed — run your own host and keep contact windows short
harvest-now-decrypt-later	residual (§8, §27.3): recorded sessions only, bounded by the recording window
traffic analysis / metadata	residual and amplified on WAN (§27.3): volume, timing and endpoints visible; mitigate with short windows and steady, unremarkable scheduling
port discovery by scanners	partial: stealth silences probes but not the open port itself; move ports, restrict by firewall where possible
SYN floods / resource exhaustion	bounded by the OS backlog and daemon threads; handshake work per attacker connection is capped by the 15 s window and fails cheap

28.6 WAN pre-flight checklist

• Reachability proven with plain connectivity before relying on it in the field.

• Fingerprints exchanged over an independent channel and verified at the first session — mandatory at distance.

• Session id read back verbally once; both ends must match.

• Agreed burn discipline: who burns, and when.

• Clock sanity: message TTLs are enforced per-message; wildly skewed clocks are an operator-error source, not a crypto one.

- Stow policy: node down outside contact windows.

Summary: LAN is GW1's native terrain; WAN is fully supported by the cryptography and the transport, and is limited only by ordinary IP reachability and the metadata cost of being on the public internet.

APPENDICES

Appendix A — Test-Vector Corpus (generated)

Every vector below is computed at book-build time by the exact code listed in Chapters 19–20, from deterministic inputs derived as SHA-256("GW1-CORPUS|LABEL|INDEX"). A conforming implementation must reproduce every value bit-for-bit. The corpus is deliberately large: it exists to be run, not read — feed it to a harness.

A.1 Published vectors pinned by the build

```

A.3 X25519 generated vectors

Each row: a clamped private scalar, the public key derived from it, and a Diffie–Hellman shared secret against a second corpus keypair (a, B). Implementations MUST clamp.

A.5 AES-256-GCM generated vectors

Nonce construction matches GW1 transport exactly: one direction byte followed by an 11-byte big-endian counter. AAD is the literal b"GW1".

```

A.6 Full-session ratchet transcripts

Three complete GW1 sessions are run inside the build. For each: both hello blobs, both confirmation MACs, the derived session id, and every sealed frame of a scripted conversation, so a black-box protocol implementation can be exercised end-to-end against a fixed record.

```
[SESSION-0] hello-c=0b7da5f88676b3e8c1eb2b3763375a00f55c7d73de7f6c38b1b165d3afd8530e

A.7 Ratchet-chain interior traces

For forty seeded chains this prints the *interior* state of gw.crypto.CipherState step-by-step: the initial chain key derived from a seeded root, then at every step the message key fed to AES and the next chain key. Derivations are saltless HKDF-SHA256 exactly as shipped. Anyone reimplementing the chain must reproduce all three columns at every step — frames alone (A.5, A.6) do not distinguish a wrong chain from a wrong nonce.

```

```

A.8 Negative vectors (must-reject corpus)

Each entry seals a message, corrupts exactly one structural field, and replays the corrupted frame against a receiver whose ratchet state matches the frame's position. Every entry MUST be rejected with SecurityError; the expected message is printed. Modes: TAG = GCM authentication failure (tag, ciphertext, nonce or direction-byte edits), SEQ = counter desync, LEN = truncated frame.

```

Appendix B — Validation Suite Source

docs/validate_gw1.py, shipped verbatim. It re-runs the pinned published vectors (A.1) and 25 full handshakes with tamper checks. Exit code 0 is a release gate.

validate_gw1.py

```
"""GHOSTWIRE GW1 validation suite (Tier 1 + Tier 3).

Run on any host or CI before releasing a build:

    python3 validate_gw1.py

Exits non-zero on the first failed assertion.  The generated corpus
(Appendix A of the book) is produced deterministically by
book_appendix.py with the same seeded inputs, so this validator and
the printed book always agree.

Appendix C — Glossary

term	meaning in GW1
AEAD	Authenticated encryption with associated data — AES-256-GCM here.
AAD	The associated-data bytes authenticated but not encrypted; literal b"GW1".
bind	First client hello hash folded into the server signature to kill downgrade.
chain	HKDF-based per-direction message-key sequence; one hop per frame.
clamp	RFC 7748 scalar conditioning (clear 3 LSBs, set bit 254, clear 255).
confirmation MAC	Per-role HMAC proving both sides derived the same root key.
HKDF	RFC 5869 extract-and-expand KDF; SHA-256 throughout.
identity key	Long-term Ed25519 keypair; used only for hello signatures.
ladder	Montgomery ladder — X25519 scalar multiplication.
nonce	12-byte GCM nonce = 4-byte direction tag || 8-byte counter.
probe	8-byte GW1PROBE reconnaissance answered without leaking protocol state.
root key	32-byte HKDF output of the handshake; seeds both chains.
ratchet	Forward-secrecy key stepping: hkdf(chain, info) per message.
session id	SHA-256 of the handshake transcript; UI-visible pairing check.
softinput_mode	Kivy keyboard policy; 'below_target' + adjustPan in this app.
transcript	Ordered byte record of every handshake field, hashed for keys.
TTL	Per-frame lifetime enforced by receivers; expired frames are dropped.

Appendix D — Normative References

RFC 2104 — HMAC: Keyed-Hashing for Message Authentication (Krawczyk et al.).

RFC 5869 — HMAC-based Extract-and-Expand Key Derivation Function (Krawczyk, Eronen).

RFC 7748 — Elliptic Curves for Security (Langley, Hamburg, Turner).

RFC 8032 — Edwards-Curve Digital Signature Algorithm (Josefsson, Liusvaara).

RFC 8439 — ChaCha20 and Poly1305 — nonce construction rationale used as analogy.

RFC 5116 — An Interface and Algorithms for Authenticated Encryption (McGrew).

NIST SP 800-38D — Recommendation for Block Cipher Modes of Operation: GCM.

FIPS 180-4 — Secure Hash Standard (SHA-256).

FIPS 198-1 — The Keyed-Hash Message Authentication Code (HMAC).

Bernstein 2006 — Curve25519: new Diffie–Hellman speed records.

Bernstein 2012 — Ed25519: high-speed high-security signatures.

Marlinspike, Perrin — The Double Ratchet Algorithm (Signal, 2016) — lineage of §10.

Appendix E — Book Changelog

rev	date	change
1.0	2026-09-21	Initial release for GHOSTWIRE v1.0.0 / GW1 protocol.
1.1	2026-09-21	GHOSTWIRE v1.1.0: strict peer-to-peer with operator request gate (§21.2, §26.3); opaque WAN relay source printed (§21.3, §28.3); TTL presets 60 s / 1.5 m / 2 m / 3 m / 5 m (§17.2, §26.6); sweep stealth fix (§26.5); STANDARDS & RFC panel in-app and in print (§26.7, front matter).

End of book. Developed by @Ariko & Arena.
